Bellabeat Data Cleaning Changelog

- 06-04-26: Prepared and processed data: The Fitbit activity and sleep datasets were imported into Python using Pandas. Column names were standardized to lowercase, date fields were converted to datetime format, and duplicate records were identified and removed from the sleep dataset. Missing values and invalid records were investigated, and numeric fields were validated to ensure appropriate data types. Additional variables, including day of week and standardized date fields, were created to support analysis. Finally, activity and sleep datasets were merged using user ID and date, creating a single analysis ready dataset. Data integrity was verified through duplicate checks, datatype validation, descriptive statistics, and manual inspection of merged records.
